**Introduction**

A new species of a dielasmid brachiopod from the Triassic Saharonim Formation of Makhtesh Ramon, southern Israel, was discovered in Anisian-Ladinian limestones that alternate with calcareous shales. The environment of deposition was an open shelf with normal salinity. The new species is homeomorphic with Paleozoic forms, but may not belong to the genus Dielasma; however, it may be a species of Tunethyris, a Triassic genus from Tunisia. If the Triassic specimens belong to the Paleozoic genus Dielasma, an important new Lazarus genus is added to the systematic literature. However, if the specimens belong to the Triassic Tunethyris, there are important paleobiogeographic considerations to be noted, such as the significance of the enigmatic Ladinian crisis and the influence of the Hispanic Corridor, an immature seaway connecting the western Tethys with eastern Panthalassa that may have been open sporadically during the Late Triassic and affected brachiopod distribution.

Feldman, H. R. 2013. Tunethyris wilsoni (Brachiopoda), a new genus and species from the Middle Triassic (Ladinian) of southern Israel. Annales Societatis Geologorum Poloniae, 83:81-85.

**Tunethyris blodgetti** n. sp. on left, *T. punica* on right. Serial sections of each are below.

**Conclusions**

Points favoring the selection of Tunethyris are:

1. The orientation of the crura in the new species is slightly different from Paleozoic dielasmids, especially *D. elongatum* from the Permian of Germany.

2. The anatomy of Tunethyris punica from the Norian of Tunisia is very similar to the new species and the anterior commissure of both is sulcuplicate, a feature not found in Paleozoic forms.

3. The loop of the Israeli brachiopods is acuminate. In addition to other anatomical characters that support the erection of a new species, Tunethyris punica has a septalium supported by a median septum whereas the septalium in the brachiopods from Makhtesh Ramon rests on the valve floor.

**Acknowledgements**

The fossils were collected during Feldman’s tenure as a Visiting Scientist at the Geological Survey of Israel in Jerusalem. Thanks to Daniel Levin (USNM) for providing access to the collections. We are grateful to the following for discussions and an exchange of ideas related to the stratigraphy and depositional environments of the Triassic rocks in the Negev: Chaim Benjamini (Ben Gurion University, Beersheba, Israel), Hugo Bucher, Université Claude Bernard, Lyon, France), and Francis Hirsch (Naruto University of Education, Naruto, Japan). Support from the National Geographic Society is greatly appreciated.
