Predatory Publishers: What to Know and How to Avoid Them
Susan Lesser, MLS and Lara Lasner-Frater, MA, MLS, Touro College of Osteopathic Medicine/College of Pharmacy Library

What Are Predatory Publishers?
Predatory publishers exploit the emerging acceptance of open-access academic journals by making it attractive to publish, especially in a journal or periodical. They aggressively solicit articles from faculty and researchers with the intention of exploiting authors who need to publish their research findings in order to meet promotion, tenure or grant funding requirements.

The ultimate goal of these publishers is to make a profit, not to promote scholarly research. They have no concern for the quality of work published and typically lack the peer-review process that legitimate journals provide. Articles are often accepted without any changes. They have unethical business practices (such as charging exorbitant author publishing fees).

Predatory conferences are a similar type of scam. These conferences appear to be legitimate scientific events, but in reality provide only a few presentations, or combine a wide range of topics into a single conference.

Why is it important for future doctors and pharmacists to learn about predatory publishing?
- Predatory publishing damages the reputation of the biomedical and pharmaceutical fields due to a lack of comprehensive peer review. It helps create a rise in pseudo science and perpetuates bad research. Legitimate publishers are committed to preserving published work.
- Legitimate publishers are focused on making money, and do not care about preserving the articles they publish. Papers can disappear from a journal’s website at any time, making it difficult to prove a paper was ever published.
- Predatory publishers often claim their journals are indexed in popular databases such as Scopus, PubMed, or Web of Science, when in fact they are not. It is easy to verify these claims by doing a journal search in these databases.
- Publishing in a predatory journal can harm your reputation, the reputation of your institution, and your career advancement.

Case Studies
MedCrave’s “Urology & Nephrology” published the above article about Uromystisis. The paper was sent in under the name “Dr. Martin van Nostrand”. It was scheduled for peer review and was accepted with minimal revisions three days later. The author was asked to pay $799.

Some characteristics of predatory publishers are:
- “Cuckoo for Coco Puffs?” The surgical and neoplastic role of cocoa extract in breakfast cereals was a paper “authored” by “Pinkerton A. LeBrins” and “Ozron Weest”. It was written in 2015 and accepted by more than 17 journals, including the “Global Journal of Otolaryngology” in 2017 (two years after the scam was exposed). The address of one of these publishers is actually a strip club.
- Four journals accepted a paper on “Mid-chlorians” (scientific name for “The force” in the Star Wars movies). The fake author, “Dr. Lucas McGeorge” was invited to serve on the editorial board of one journal.
- A fake journal published a paper that just repeats the phrase, “Get me off Your F**king mailing list”.
- “Anna O. Suzuki” (see graphic below) applied to be an editor at 300 open access journals. She was accepted by 48, and four made her editor-in-chief. “Duziz” means fraud in Polish.

Because I could get "Uromystisis" poisoning and die, that’s why.

Some common characteristics of predatory publishers are:
- Webpages contain bogus journals.
- Images appear distorted or fuzzy.
- No ISSN.
- Vague or incomplete contact information.
- Promise of rapid publication.
- Unethical or deceptive publishing fees and copyright policies.
- Fake names are listed on the editorial staff. Names of prominent scholars are included as editors without the knowledge or consent of these individuals.
- Published articles are plagiarized, completely fake, are scientifically unsound, or low quality.
- Websites contain many grammatical, spelling and formatting errors. An example from Medcrave is, “Construction for a written scientific manuscript needs deep study and writing the scientific facts with the top level of accuracy”.

How to Spot a Potential Predatory Publisher
Predatory Publishers tend to be savvy and employ tricks to seem legitimate. One such trick is to use a name similar to a prestigious journal’s. For example, “American Journal of Pharmaceutical Education” is a legitimate journal while “American Journal of Pharmacy and Health Research” is potentially predatory.

Not all Open Source is the Same
Just because a journal is open access or charges a fee does not mean it is predatory. Many prestigious high-impact journals are open access (such as the PLOS journals). The graphic below illustrates the difference.
